

Welcome to the next phase of the XCD trial!

By now you should have a Mirabella device that is successfully running our software and is online in your home.

We have been doing some background testing and development of this setup over the last week or so and are now ready to connect you with our Test webapp.

In this phase we will not be controlling your devices. Rather we will just be monitoring how and when they are used.

This data will be captured along with details of the appliance type you have connected.

Once established this information will allow us to predict the type of device connected when it is plugged in, and automatically start optimizing its energy usage.

Appliance control

In order for us to see what is happening and how you interact with your devices we ask that over the coming weeks you only use this application to control and interact with your appliance.

Specifically we ask you to use the webapp as a replacement to your AC's standard remote control, the switch on wall outlet or the on/off button to control your appliance.

Feedback

We want to know about your experience with our technology and our app!

We've tried to build this webapp with all the common features you would typically use for your appliances. We ask that if there's something missing you use often, something that went wrong or any recommendations please let us know.

You should expect a call from a RedGrid team member shortly to discuss any feedback you have on the experience.

This is a test app!

Please note that this WebApp has been built for our testing process only so may not be as mature or amazing as other home automation apps you've used.

For now though we've had to build a simplified version to provide this control in order for us to start testing and developing our internet of energy ecosystem.

More to come - RedGrid
